CHAPTER VI SOURCES, METHODS AND DATA CONSIDERATIONS

The international refugee instruments, such as the 1951 Convention and the 1969 OAU Convention, provide a clear refugee definition. The fact that more than 140 countries have acceded to the 1951 Convention or its 1967 Protocol and incorporated the refugee definition in their national legislation makes refugees relatively easy to count. As refugees can only be adequately protected when they are registered, refugee statistics are generally based on individual registration records, kept by the host Government. In many instances, UNHCR supports countries in the registration of refugees.

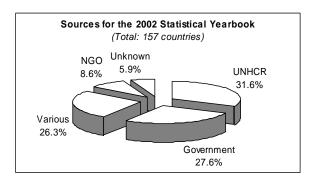

Although there is a clear refugee definition and administrative procedures to support this, keeping accurate statistics may not be as straightforward as it seems. First, there may be a difference of opinion between UNHCR, NGOs and the host country about who is a refugee. For instance, nationals fleeing conflict in their country may be welcomed as refugees by some countries, but not by others. Second, although refugees are often registered individually, the accuracy of registration varies greatly, depending on the protection and operational environment. Third, refugees may not be aware of the need to register or may perceive the costs of registration higher than its benefits. Fourth, some countries grant not only Convention refugee status, but also subsidiary forms of protection, which are difficult to compare internationally. Fifth, even though there is an international refugee definition, the administrative rules governing the granting of refugee status vary. Sixth, administrative records tend to overestimate the actual number of persons, because it is easier to register than to de-register. This is particularly the case when registration is linked to the provision of services or benefits.

Sources

In most countries, there is no single source from which the population of concern to UNHCR can be derived. Whereas the refugee or aliens register may be the source of refugee statistics, asylum-seeker data are often derived from a separate administrative system. Adding to the complexity, voluntary repatriation and resettlement are often managed by separate government agencies or implementing partners. Sources may also differ between regions. In many countries, refugee registration is not centralized, but maintained at the local level, requiring periodic consolidation. Some refugee characteristics, such as gender, age and special needs, may not be available from the register, but only collected through surveys. In short, a combination of sources is generally required to obtain a comprehensive statistical picture.

In most industrialized countries, the host Government is generally the sole data provider. In most non-industrialized countries, UNHCR assists the host country in refugee registration for the purpose of international protection, assistance or durable solutions. This assistance may vary from providing technical advice and limited assistance in countries with a more developed statistical infrastructure to managing thousands registration records on a daily basis in countries with limited means.

In addition to the size of the population, UNHCR records and collects other data which have an impact on population size, including births, deaths, new arrivals, durable solutions and changes in the legal changes.

By the end of 2002, UNHCR was the single source of statistics in 48 countries (32%); governments were the sole data provider in 42 countries (28%), whereas NGOs maintained data at the request of UNHCR in 13 countries (9%).

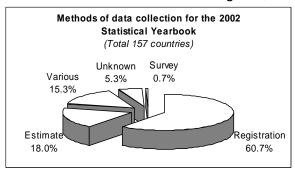

In 40 countries, there was more than one data source (26%). In 31 of these 40 countries, statistics were a combined

responsibility of the Government and UNHCR. In total, UNHCR was quoted as either the single source or one of the sources for statistics in 86 countries. Governments were the single source or one of the sources in 81 countries (see *Table VI.1*).

Methods of data collection

Each data collection method has its own strengths and limitations. A register is created to establish a legal record, to administer entitlements or to deliver services. In a register, all

persons are included and records should be updated regularly. As pressures to register outweigh those to de-register, data from a become inflated. register may requiring periodic corrective action. Surveys censuses are excellent sources for planning purposes, but do not allow for follow-up at the individual level. Although a census includes each individual, it provides only a "snap-shot" of the situation and quickly becomes outdated.

Registration was the sole source of refugee statistics in 91 countries (61% of the countries), estimates formed the basis in 27 countries (18%), more than one method of data collection were reported by 23 countries (15%), whereas surveys were the data source in only one country (0.7%). In 22 of the 23 countries where more than one method of data collection was used, registration was mentioned as one of the methods (see Table VI.1).

Among the 27 countries where only estimates are used, 16 are industrialized countries without a refugee register. In these 16 countries, UNHCR estimates the size of the refugee population based on official data on refugee arrivals and the number of asylum-seekers who are recognized (see below).

UNHCR carries out registration and data collection in support of its activities to protect and assist refugees. Most attention is focused on refugees in immediate need of support. Refugees who are living outside camps, sometimes unlawfully, are more difficult to track and are underrepresented in the UNHCR statistics. Nevertheless, estimates for self-settled refugees are included in the statistics for a number of African countries.

Refugee registration is often subject to significant adjustments as a result of verification campaigns. As a result, the population size in refugee camps is sometimes subject to

significant periodic adjustments. Population adjustments due to registration were discussed in some detail in Chapter II.

Refugee population estimates in industrialized countries

As noted earlier, a number of industrialized countries lack a refugee register and are thus not in a position to provide accurate information on the number of refugees residing in their country. To ensure that these countries are nevertheless reflected in the global refugee statistics, UNHCR estimates the refugee population in these 16 countries, located in Europe, North America and Oceania, based on refugee arrivals and the recognition of asylum-seekers over a 10-year (Europe) or 5-year (North America and Oceania) period respectively. These different cut-off periods reflect the time it generally takes for a refugee to acquire the nationality of his/her host country.

To illustrate the above methodology, two examples are provided below, using official Government statistics.

Example 1: Canada

- a. Immigration ("landings") of Convention refugees, 1998-2002: 74,371
- b. Immigration ("landings") of resettled refugees, 1998-2002: 55,576

UNHCR estimate of the refugee population, end of 2002: 129,947

Example 2. United Kingdom

a. Asylum-seekers granted Convention refugee status in first instance, 1993-2002: 72,855

- b. Asylum-seekers allowed to remain for humanitarian reasons ("exceptional leave to remain") in first instance, 1993-2002: *112,190*
- c. Asylum-seekers granted Convention refugee status and "exceptional leave to remain" under the backlog programme of 1999-2000: 29,249
- d. Asylum seekers recognized in appeal during 1994-2002: 45,533¹⁵
- e. Resettlement arrivals (1993-1996): 860

UNHCR estimate of the refugee population, end of 2002: 260,687

Number of persons estimated by UNHCR based on an average of 1.3 persons per asylum case (35,025 recognized cases x 1.3 = 45,533 persons recognized). Data for 1993 not available or not applicable.
